DM54155/DM74155 Dual 2-Line to 4-Line Decoders/Demultiplexers
General Description

These TTL circuits feature dual 1-line-to-4-line demultiplexers with individual strobes and common binary-address inputs in a single 16-pin package. When both sections are enabled by the strobes, the common address inputs sequentially select and route associated input data to the appropriate output of each section. The individual strobes permit activating or inhibiting each of the 4-bit sections as desired. Data applied to input C1 is inverted at its outputs and data applied at C2 is true through its outputs. The inverter following the C1 data input permits use as a 3-to-8-line decoder, or 1-to-8-line demultiplexer, without external gating.

Input clamping diodes are provided on these circuits to minimize transmission-line effects and simplify system design.

Features

■ Applications:
  Dual 2-to-4-line decoder
  Dual 1-to-4-line demultiplexer
  3-to-8-line decoder
  1-to-8-line demultiplexer
■ Individual strobes simplify cascading for decoding or demultiplexing larger words
■ Input clamping diodes simplify system design

Note: *The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.*
